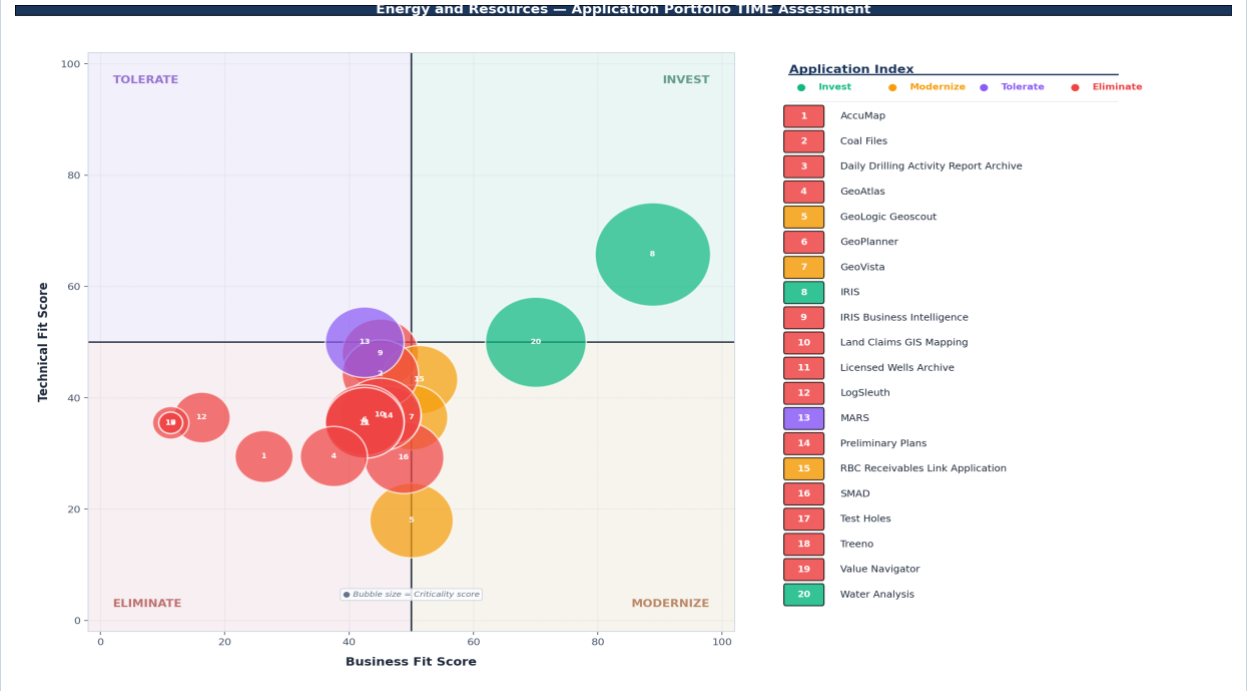
Portfolio Snapshot

22	20	2	Feb–Mar 2026
Total Applications	Assessed	Incomplete Data	Assessment Period



TIME	#	% Assessed
Invest	2	10%
Modernize	3	15%
Tolerate	1	5%
Eliminate	14	70%

Key Portfolio Insights

- 70% of the assessed portfolio (14 of 20 applications) is positioned in Eliminate, reflecting accumulated technical legacy against declining business relevance across a large portion of the ministry's application inventory.
- **IRIS - Integrated Resource Information System** is the portfolio's highest-criticality asset (88.8), correctly positioned in Invest with Crown Jewel designation. Its scores were found to be inverted with **IRIS Business Intelligence** in the source data and have been corrected in this report.
- **GeoLogic Geoscout** represents the most time-pressured Modernize application — the lowest technical fit score in the portfolio (18.0) combined with ITDNAS-End-Of-Life infrastructure status.
- **Geoscience Data Management** carries the highest criticality (60.0) of the two incomplete-data applications and warrants priority follow-up before the next portfolio planning cycle.

Abstract

This report presents the findings of the Application Portfolio TIME Assessment conducted for the Ministry of Energy and Resources, Government of Saskatchewan. The assessment was administered across 22 business applications using the TIME methodology, adapted from the Gartner Application Portfolio Management framework. Each application was evaluated against ten business fit factors (B1–B10) and fourteen technical fit factors (T01–T14), yielding normalized scores on a 0–100 scale for Business Fit, Technical Fit, and Criticality. Applications were subsequently positioned within one of four strategic quadrants — Invest, Tolerate, Modernize, or Eliminate — based on the intersection of their Business Fit and Technical Fit scores. Bubble size in the portfolio visualization represents the Criticality score, providing a risk-weighted view of each application's portfolio position.

The assessment was conducted by the APM Team, Ministry of Energy and Resources, in collaboration with application owners, technical architects, and subject matter experts across the ministry. Assessment sessions were facilitated between February and March 2026. Two applications — **Geoscience Data Management** and **SMDI - Saskatchewan Mineral Deposits Index** — could not be fully assessed due to incomplete data and are excluded from quadrant analysis pending follow-up assessment sessions. One data quality issue was identified during report preparation: the assessment records for **IRIS - Integrated Resource Information System** and **IRIS Business Intelligence** were found to have been recorded with inverted scores. This error has been corrected in the present report; the source data should be updated accordingly.

Assessment Methodology

Each application was assessed using two standardized factor sets. Scores for each factor are recorded on a 1–5 scale and normalized to 0–100.

Business Fit Factors (B1–B10)	Technical Fit Factors (T01–T14)
B1 — Strategic Contribution	T01 — Platform / Product Footprint
B2 — Regional Growth Support	T02 — Application Development Platform
B3 — Public Confidence Impact	T03 — Platform Portability
B4 — Scope of Use	T04 — Configurability & Extensibility
B5 — Business Process Criticality	T05 — Support for Modern UX
B6 — Business Interruption Tolerance	T06 — Security Controls
B7 — Essential Service Impact	T07 — Security Controls for Data Sensitivity
B8 — Current Needs Fulfillment	T08 — Identity Assurance
B9 — Future Needs Adaptability	T09 — Resilience & Recovery
B10 — User Satisfaction	T10 — Observability & Manageability
	T11 — Vendor and Support Availability
	T12 — Integration Capabilities
	T13 — Integrations
	T14 — Data Accessibility

The TIME methodology is adapted from the Gartner APM framework. SaskBuilds uses "Modernize" in place of Gartner's original "Migrate" designation to better reflect the nature of platform renewal activities within the Government of Saskatchewan context.

Assessment Team

Role	Name(s)
APM Program Lead	Ryan Brittner, Director, Enterprise Architecture — SaskBuilds and Procurement
Assessment Lead / Facilitator	Emma Zhou — Energy and Resources
Assessment Participants	He Tian — Energy and Resources, Trushil Patel, Manager, Systems Integration — Energy and Resources, Michele Wyatt — SaskBuilds and Procurement
EA / APM Advisors	Glenn Grad — SaskBuilds and Procurement, Leanne Silzer — SaskBuilds and Procurement, Stuart Holtby, Allstar Technologies

Application Owners

Application owners were not present during the assessment sessions. They are listed here as the designated owners of record for each assessed application.

Application Owner
Jenni Gasson — Energy and Resources
Colin Card — Energy and Resources
Emma Zhou — Energy and Resources
Jane McLeod — Energy and Resources
Marilyn Lolacher — Energy and Resources
Scott Weaver — Energy and Resources
Kim Olyowsky — Energy and Resources
Bruce Wilhelm — Energy and Resources
Yanyan Han — Energy and Resources

INVEST

What is Invest?

Applications in the Invest quadrant demonstrate high business fit and strong technical health. They are core to operational delivery and are built on sustainable, modern platforms. Continued investment in maintenance, enhancement, and capability growth is warranted. These applications represent the portfolio's highest-value digital assets and carry the greatest risk if disrupted or allowed to decline.

Pattern Narrative

IRIS - Integrated Resource Information System and **Water Analysis** are the only applications positioned in Invest, distinguishing them from the rest of the Energy and Resources portfolio. **IRIS - Integrated Resource Information System** carries Crown Jewel designation and the highest criticality score in the ministry (88.8). Its B-factor profile reflects strong strategic alignment (B1: 5), mission-critical process dependency (B5: 5), and direct relevance to mandate delivery (B7: 5). On the technical side, **IRIS - Integrated Resource Information System** scores adequately but not exceptionally (Tech Fit 65.8), with a legacy client-server platform (T01: 2) and an obsolete development environment (T02: 1) offset by strong integration capabilities (T12: 4) and modern data accessibility (T14: 5). **Water Analysis** serves a clear operational mandate with strong strategic contribution (B1: 5) and regional growth alignment (B2: 5), but sits precisely at the 50-point technical fit threshold with a transitional development platform (T02: 3) and basic security compliance (T06: 3).

Applications — Ranked by Criticality

★ denotes Crown Jewel designation

#	Application Name	Criticality	Business Fit	Tech Fit	Lifecycle Status
9	IRIS - Integrated Resource Information System ★	88.8	88.8	65.8	Mainstream Support
22	Water Analysis	67.5	70	50	Mainstream Support

Criticality-Weighted Insight

IRIS - Integrated Resource Information System at 88.8 criticality is the single most operationally significant application in the portfolio. Its technical fit of 65.8 is adequate but not exceptional — sufficient to remain in Invest, but not so strong that the platform can be taken for granted. The legacy client-server architecture (T01: 2) and obsolete development platform (T02: 1) represent ongoing technical debt that, if left unaddressed, could push this application toward Modernize at a future assessment cycle. **Water Analysis** sits precisely at the 50-point technical fit threshold; any further decline in technical health without corresponding investment would shift this application into Modernize territory at the next assessment cycle.

MODERNIZE

What is Modernize?

Applications in the Modernize quadrant deliver meaningful business value but are constrained by aging or inadequate technical foundations. The business case for continued use is present; however, the platform, infrastructure, or development environment has not kept pace with organizational needs or current standards. Re-platforming, upgrading, or transitioning to modern alternatives is indicated. SaskBuilds uses 'Modernize' in place of Gartner's original 'Migrate' designation to reflect the broader range of renewal approaches applicable in a government context.

Pattern Narrative

The three Modernize applications share a business fit cluster at or just above the 50-point threshold, each retaining sufficient organizational relevance to justify continued investment. What distinguishes this group most sharply is the severity of their technical positions. **GeoLogic Geoscout** carries a technical fit score of 18.0 — the lowest in the entire assessed portfolio — while running on ITDNAS-End-Of-Life infrastructure. **GeoVista** and **RBC Receivables Link Application** sit in Extended Support with moderate technical scores, suggesting they are aging but not yet in crisis. B-factor assessments across the group reflect applications that support visible operational functions — resource management workflows, geoscience data visualization, and financial receivables processing — but have not kept pace with user expectations or organizational growth.

Applications — Ranked by Criticality

#	Application Name	Criticality	Business Fit	Tech Fit	Lifecycle Status
5	GeoLogic Geoscout	46.3	50	18	ITDNAS-End-Of-Life
16	RBC Receivables Link Application	38.8	51.3	43.3	Extended Support
7	GeoVista	35	50	36.5	Extended Support

Criticality-Weighted Insight

GeoLogic Geoscout demands the most immediate EA attention in this quadrant. A technical fit score of 18.0 on ITDNAS-End-Of-Life infrastructure, combined with a criticality of 46.3 and recorded ITSM activity (7 incidents, 3 requests, 1 problem over 24 months), signals a platform under active operational stress. The infrastructure lifecycle status alone — ITDNAS-End-Of-Life — constitutes an active planning trigger. **RBC Receivables Link Application** and **GeoVista** carry Extended Support status and more moderate technical scores, providing more runway, but both sit close enough to the Eliminate boundary on business fit that a further decline in organizational relevance could shift their quadrant position at the next assessment cycle.

TOLERATE

What is Tolerate?

Applications in the Tolerate quadrant exhibit adequate technical health but deliver limited strategic business value. These systems continue to function reliably but are not aligned with the organization's core mandate or growth priorities. The appropriate posture is to maintain as-is, limit further investment, and monitor for a natural exit or replacement opportunity. Tolerate applications are often candidates for consolidation as the broader portfolio evolves.

Pattern Narrative

MARS - Mineral Administration Registration System is the sole application in the Tolerate quadrant, with a business fit of 42.5 paired with a technical fit of exactly 50.0. Its Business/Vendor Managed lifecycle status indicates the application is maintained and supported externally, limiting the ministry's direct control over its technical trajectory and roadmap. The criticality score of 41.3 places **MARS - Mineral Administration Registration System** in the moderate dependency range — present enough to require a managed approach if the vendor relationship changes, but not so critical that disruption poses immediate operational risk.

Applications — Ranked by Criticality

#	Application Name	Criticality	Business Fit	Tech Fit	Lifecycle Status
14	MARS - Mineral Administration Registration System	41.3	42.5	50	Business/Vendor Managed

Criticality-Weighted Insight

The key question **MARS - Mineral Administration Registration System** surfaces for the EA team is one of ownership and control. Given that it is vendor-managed, what visibility does the ministry have into its technical roadmap and contract renewal timeline? A change in the vendor relationship — price increase, product discontinuation, or acquisition — could force a repositioning decision without the lead time a ministry-managed application would afford. The combination of moderate criticality and external control makes this application's status worth including in any contract review or vendor management process.

ELIMINATE

What is Eliminate?

Applications in the Eliminate quadrant provide limited business value and are built on aging or unsupported platforms. They have aged past their operational relevance on both dimensions simultaneously. Planning for retirement, consolidation, or replacement is appropriate. The Criticality score determines urgency: low-criticality applications are candidates for near-term retirement, while moderate-criticality applications require sequenced exit planning to manage operational dependencies.

Pattern Narrative

The 14 Eliminate applications share consistent patterns across their assessment data. On the business side, most scored low on strategic contribution, organizational scope, and user satisfaction, indicating they serve narrow, non-strategic functions within specific branches or units. Process criticality ratings are predominantly low to moderate, suggesting these applications support work that has viable workarounds or could be absorbed through other means. Several applications were assessed with limited stakeholder participation, which may itself reflect limited organizational awareness of the application. On the technical side, the group shows a concentration of legacy client-server architectures, limited platform portability, and minimal disaster recovery posture. Many run on infrastructure that is either at end-of-life or on the ITDNAS-managed file share network, with no active vendor support path. The overall profile is a group of applications that have been maintained but not modernized — functional enough to keep running, but carrying accumulating technical debt on both dimensions.

Applications — Ranked by Criticality

#	Application Name	Criticality	Business Fit	Tech Fit	Lifecycle Status
11	Land Claims GIS Mapping	43.8	45	37	Incomplete Data
17	SMAD - Saskatchewan Mineral Assessment Data	42.5	48.8	29.3	Extended Support
3	Daily Drilling Activity Report Archive	41.3	42.5	35.5	Extended Support
6	GeoPlanner	41.3	42.5	36	End of Support
12	Licensed Wells Archive	41.3	42.5	35.5	Extended Support
10	IRIS Business Intelligence	38.8	45	48	Incomplete Data
2	Coal Files	38.8	45	44.3	Mainstream Support
4	GeoAtlas	30	37.5	29.5	End of Support
15	Preliminary Plans	28.8	46.3	36.8	Mainstream Support
1	AccuMap	22.5	26.3	29.5	Extended Support
13	LogSleuth	21.3	16.3	36.5	ITDNAS-End-Of-Life
19	Test Holes	8.8	11.3	35.5	Mainstream Support
20	Treeno	3.8	11.3	35.5	End of Support
21	Value Navigator	3.8	11.3	35.5	Extended Support

Criticality-Weighted Insight

Despite sharing an Eliminate position, the criticality scores within this group vary enough to warrant differentiated EA attention. Five applications cluster between 38 and 44 on the criticality scale — **Land Claims GIS Mapping** (43.8), **SMAD - Saskatchewan Mineral Assessment Data** (42.5), **Daily Drilling Activity Report Archive** (41.3), **GeoPlanner** (41.3), and **Licensed Wells Archive** (41.3). These represent moderate-dependency applications requiring sequenced exit planning rather than straightforward retirement. Their lifecycle statuses — a mix of Extended Support, End of Support, and Incomplete Data — add complexity to any planning effort. **IRIS Business Intelligence** (38.8) sits close to the Eliminate/Invest boundary on both dimensions (Business Fit 45.0, Tech Fit 48.0) and has a functional relationship to **IRIS - Integrated Resource Information System** that must be considered in any exit or consolidation planning. At the lower end of the criticality scale, **Test Holes** (8.8), **Treeno** (3.8), and **Value Navigator** (3.8) represent the clearest candidates for near-term retirement with minimal organizational disruption. **LogSleuth**, on ITDNAS-End-Of-Life infrastructure with a criticality of 21.3, also presents a low-risk retirement opportunity, though its active incident history (3 incidents over 24 months) warrants a brief operational check before exit.

Incomplete Data

2 applications could not be fully positioned in the TIME model due to incomplete assessment data. These applications are not included in the quadrant analysis above and require a follow-up assessment session before they can be incorporated into portfolio planning.

Geoscience Data Management

Business Fit Score	55
Criticality Score	60
Technical Fit Score	Not assessed
Lifecycle Status	Incomplete Data
TIME Position	Cannot be determined. Scores suggest Invest or Modernize. Priority follow-up recommended.
Action Required	Complete technical assessment before the next portfolio planning cycle.

SMDI - Saskatchewan Mineral Deposits Index

Business Fit Score	33.8
Criticality Score	28.8
Technical Fit Score	Not assessed
Lifecycle Status	Incomplete Data
TIME Position	Cannot be determined. Scores suggest Eliminate or Tolerate.
Action Required	Determine whether a full technical assessment is warranted given low business fit and criticality scores.

EA Handoff — Open Questions

The following questions are surfaced by the assessment data. They are portfolio-wide observations intended to frame the EA team's planning conversations. APM collects data and provides insights — it does not make decisions or prescribe outcomes.

1. **IRIS Business Intelligence** is positioned in Eliminate with scores close to the quadrant boundary (Business Fit 45.0, Tech Fit 48.0). Given its functional relationship to **IRIS - Integrated Resource Information System** — the core operational system — what downstream reporting or operational dependencies exist that would affect how any exit or consolidation of the BI layer is planned?
2. **Geoscience Data Management** carries the highest criticality score (60.0) of any application without a confirmed TIME position, and its technical assessment is described as in progress. What is the expected completion timeline, and what governance path exists to incorporate it into portfolio planning once complete?
3. Five Eliminate applications cluster between 38 and 44 on the criticality scale. What data flows, shared infrastructure, or operational dependencies exist between these applications that would affect how any exit or consolidation effort is sequenced?
4. **GeoLogic Geoscout** sits on ITDNAS-End-Of-Life infrastructure with the lowest technical fit score in the portfolio (18.0) and active ITSM history. Is there a current infrastructure exit plan for this application, and if not, at what point does the infrastructure end-of-life status become a forcing function for the modernization decision?
5. **IRIS - Integrated Resource Information System** is the highest-value asset in the portfolio with a criticality of 88.8 and Crown Jewel designation. What governance mechanism exists to ensure this application’s technical currency, platform roadmap, and lifecycle status are actively maintained and visible to the EA team?

Suggested Next Assessment Trigger

Review this portfolio assessment when any Eliminate-quadrant application reaches an infrastructure end-of-life event, contract renewal, or sustained ITSM activity threshold — or when the Geoscience Data Management technical assessment is completed.
